UiPath
AGENTIC AUTOMATION

What makes a great AI agent?

Not all AI agents are created equal. The best ones have capabilities that let them deliver outstanding performance while integrating quickly and safely into your operations. Here's what to look for…

They can use many different tools to get their work done

I can do this...

They leverage intelligent document processing (IDP) capabilities to read, understand, and extract data from structured documents and unstructured communications

They'll connect to systems and apps through existing API and UI-based automations

They can direct robots to perform structured tasks that require high reliability and security

They'll work everywhere

They can move across your entire enterprise ecosystem of apps and tools—not just within a single application

They're well-governed and trustworthy

They work within a secure enterprise-grade platform with guardrails and controls

Their actions are monitored and measured, so they can adjust and improve over time

They'll bring humans into the loop if they encounter an issue or exception—interacting in natural language

They're created in a low-code environment

Easy to test, update, and refine

Can be built by process owners and business user

They're part of orchestrated processes, end to end

People
supervise, prompt agents, step in as needed

Agents
turn prompts into plans, plans into action

Robots
execute plans, efficiently and accurately

Agentic orchestration

How do you get great AI agents? With UiPath!

Build an AI agent

Orchestrate an agentic workflow
